

# ABSTRACT

In a cold-curing mortar or concrete composition  
5 comprising calcareous and siliceous materials as predominant  
components, 0.3-2.5 wt% based on the calcareous material of a  
silicone oil having formula (1) is added. R is C<sub>3-12</sub> alkyl, R'  
is C<sub>1-4</sub> alkyl, y is such an integer that the number of R is  
5-50 mol% of the total number of substituent groups directly  
10 attached to silicon atoms in a molecule, z is an integer of  
0-5, and 3 ≤ x+y+z ≤ 30. The set composition is improved in  
water repellency without incurring a drop of strength.
